

[PORTABLE
TENTACLE 44]

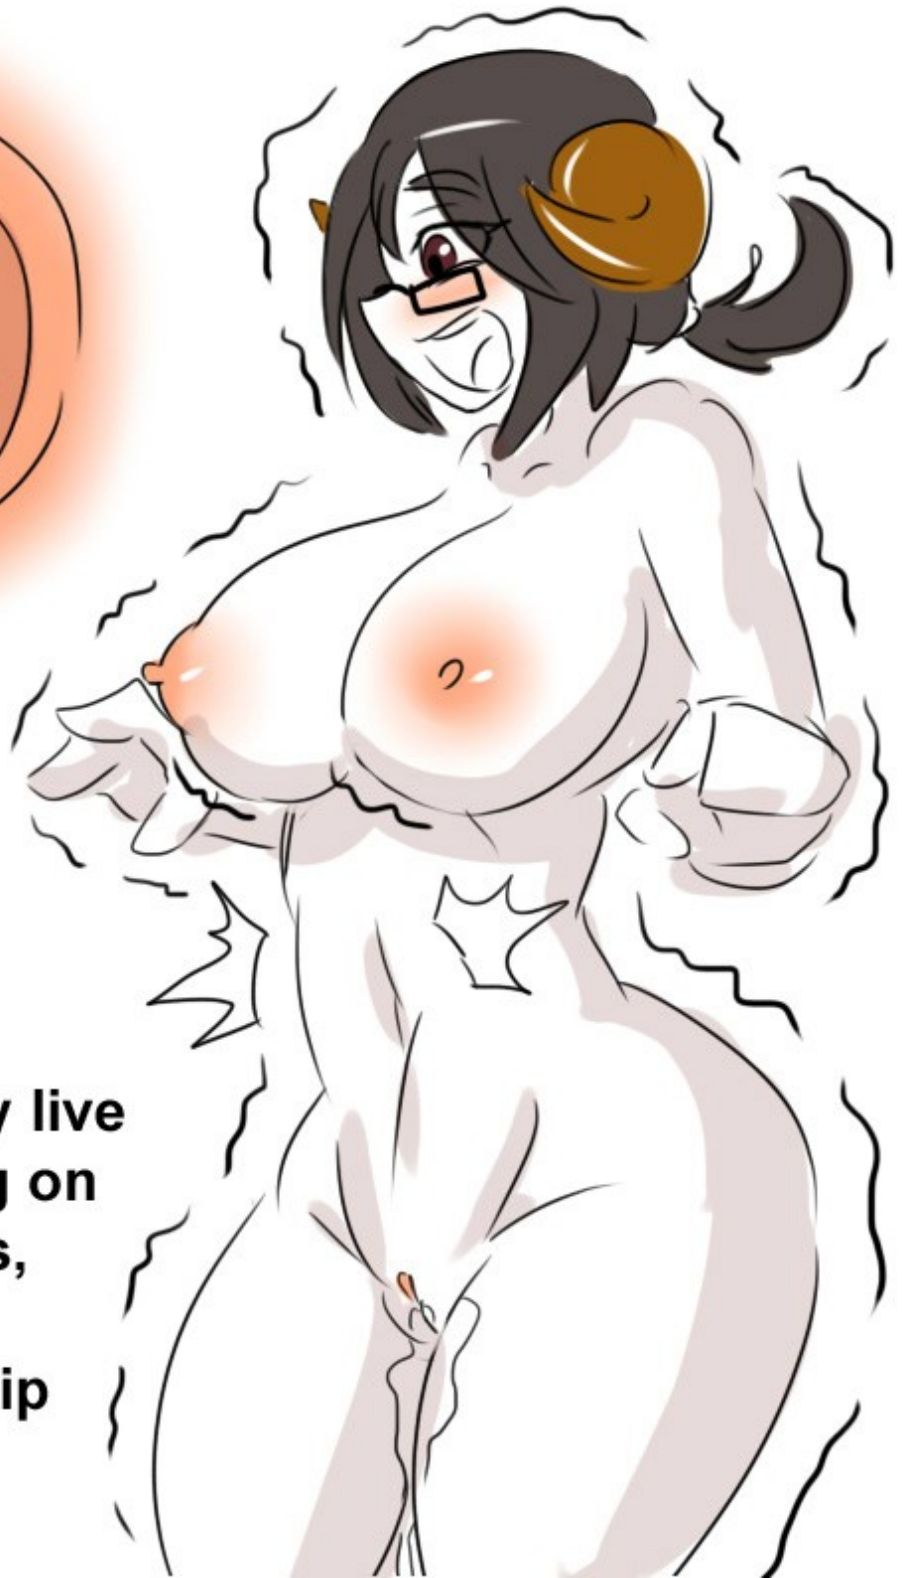

Tentacle 44 feeds on the secretion of the human body, they sneak in while the women were taking a shower, they're naturally stealthy...

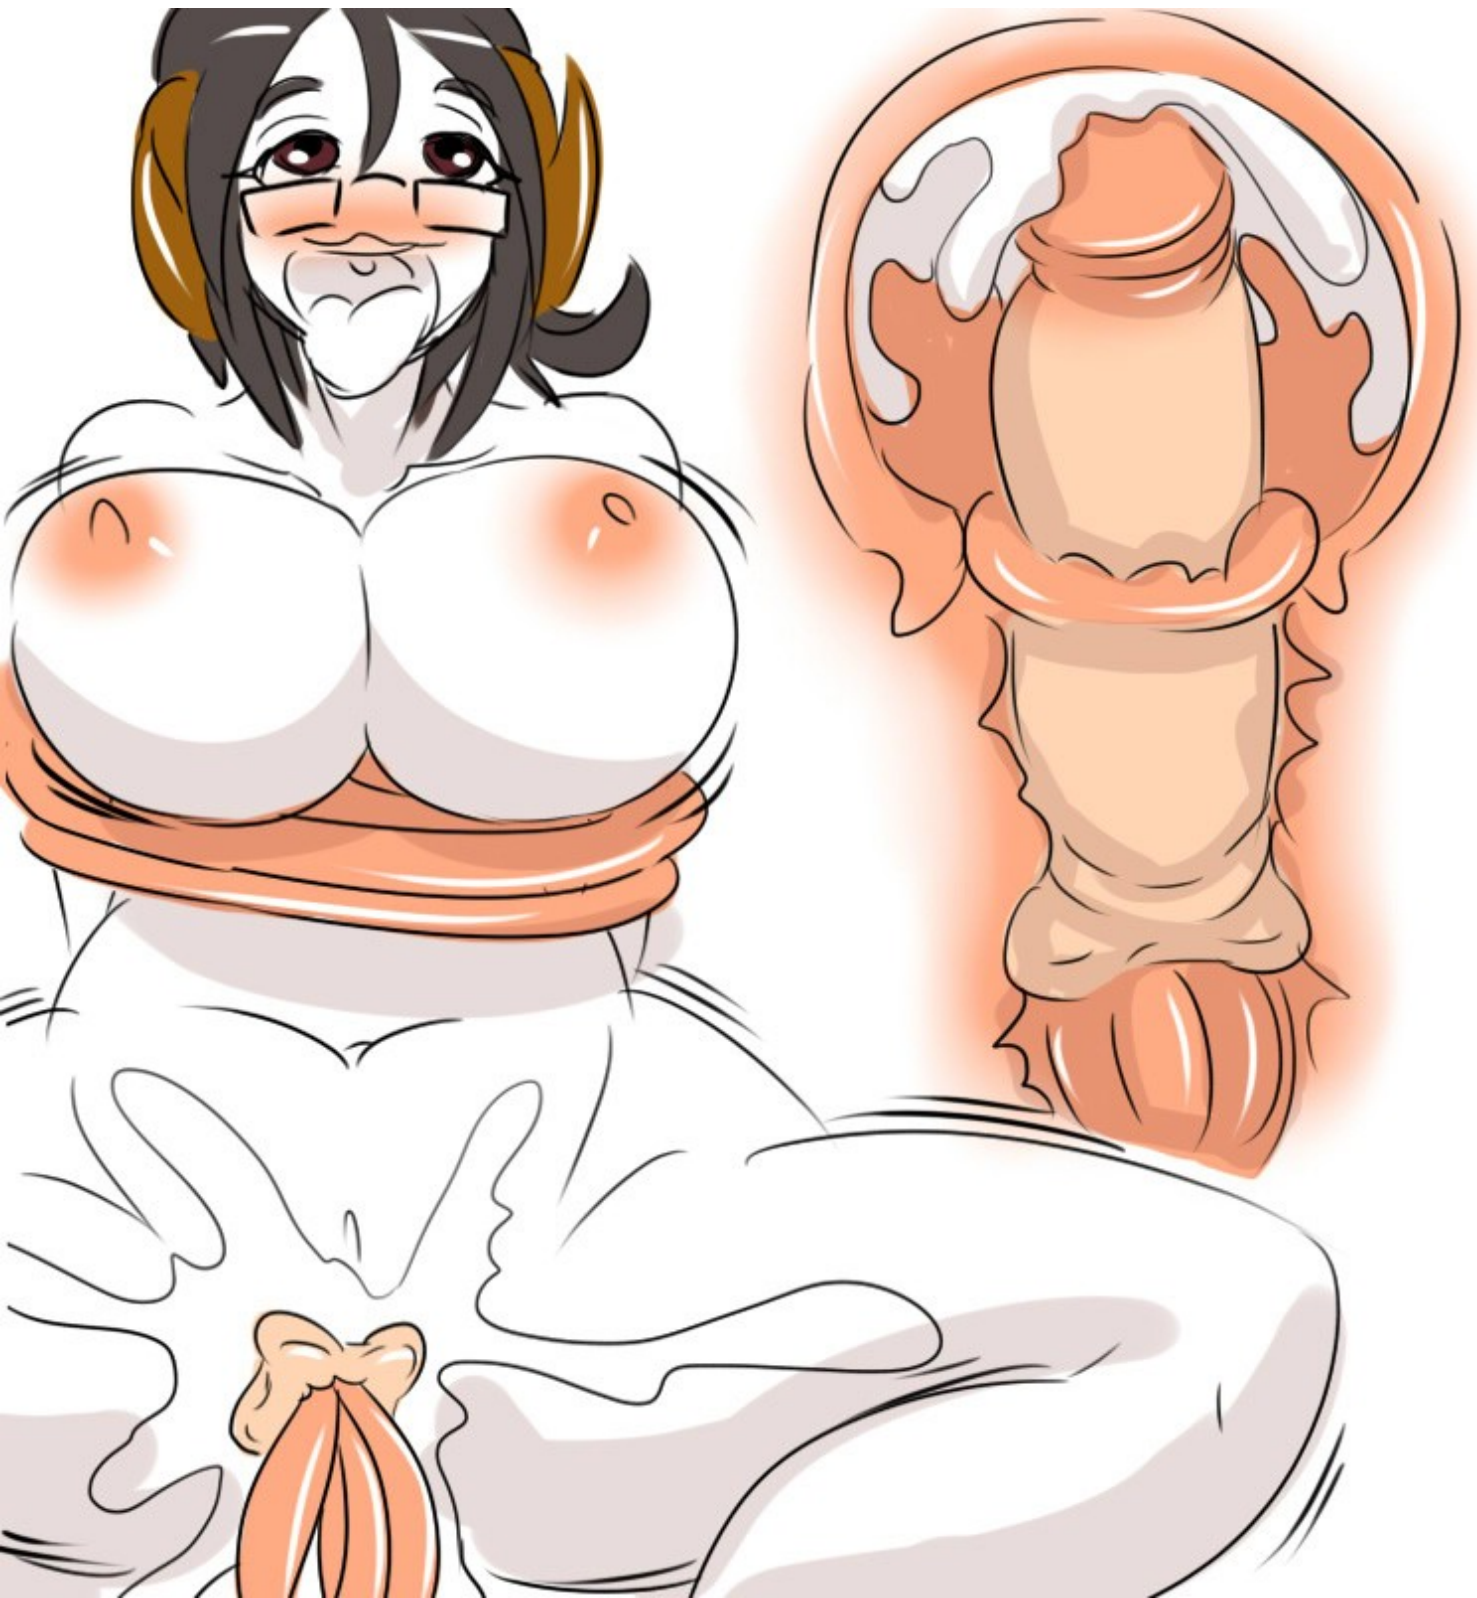

When Tentacle 44 enters the body, they live in the womb, feeding on the host's secretions, and maintaining a symbiotic relationship with the host.

Tentacle 44 satisfies the host's sexual desires, grasping their body with the four tentacles at its base.

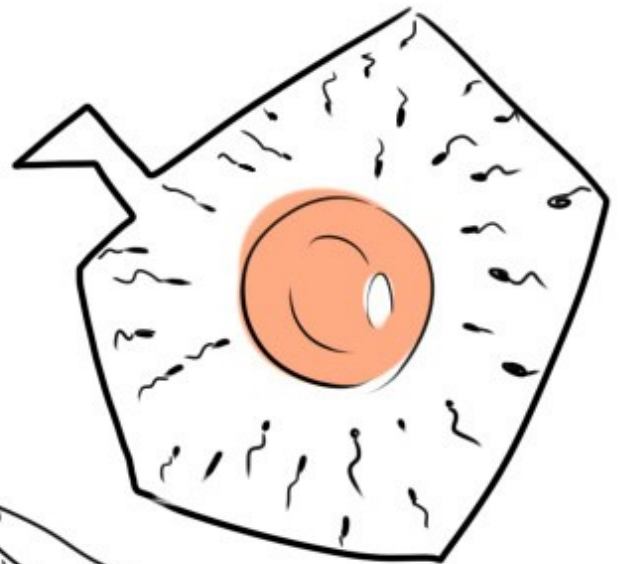

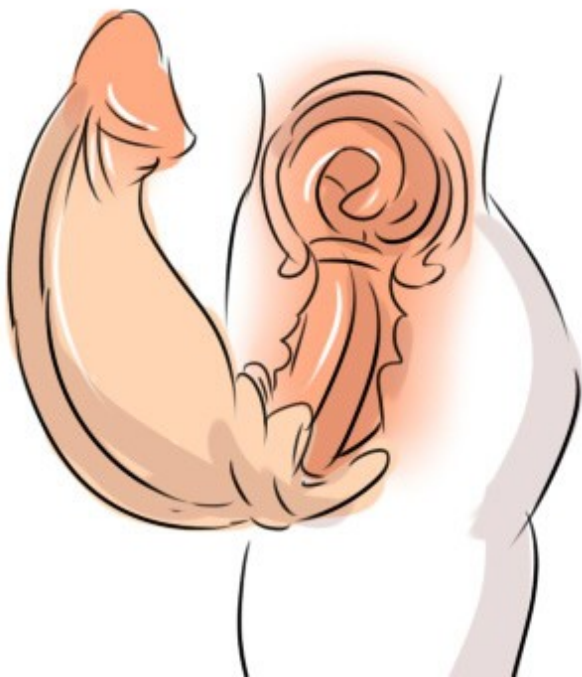

Each month, Tentacle 44 works with the host's ovulation date to increase production, inseminating the host's eggs for the purpose of breeding offspring. It only takes a week after the host is pregnant

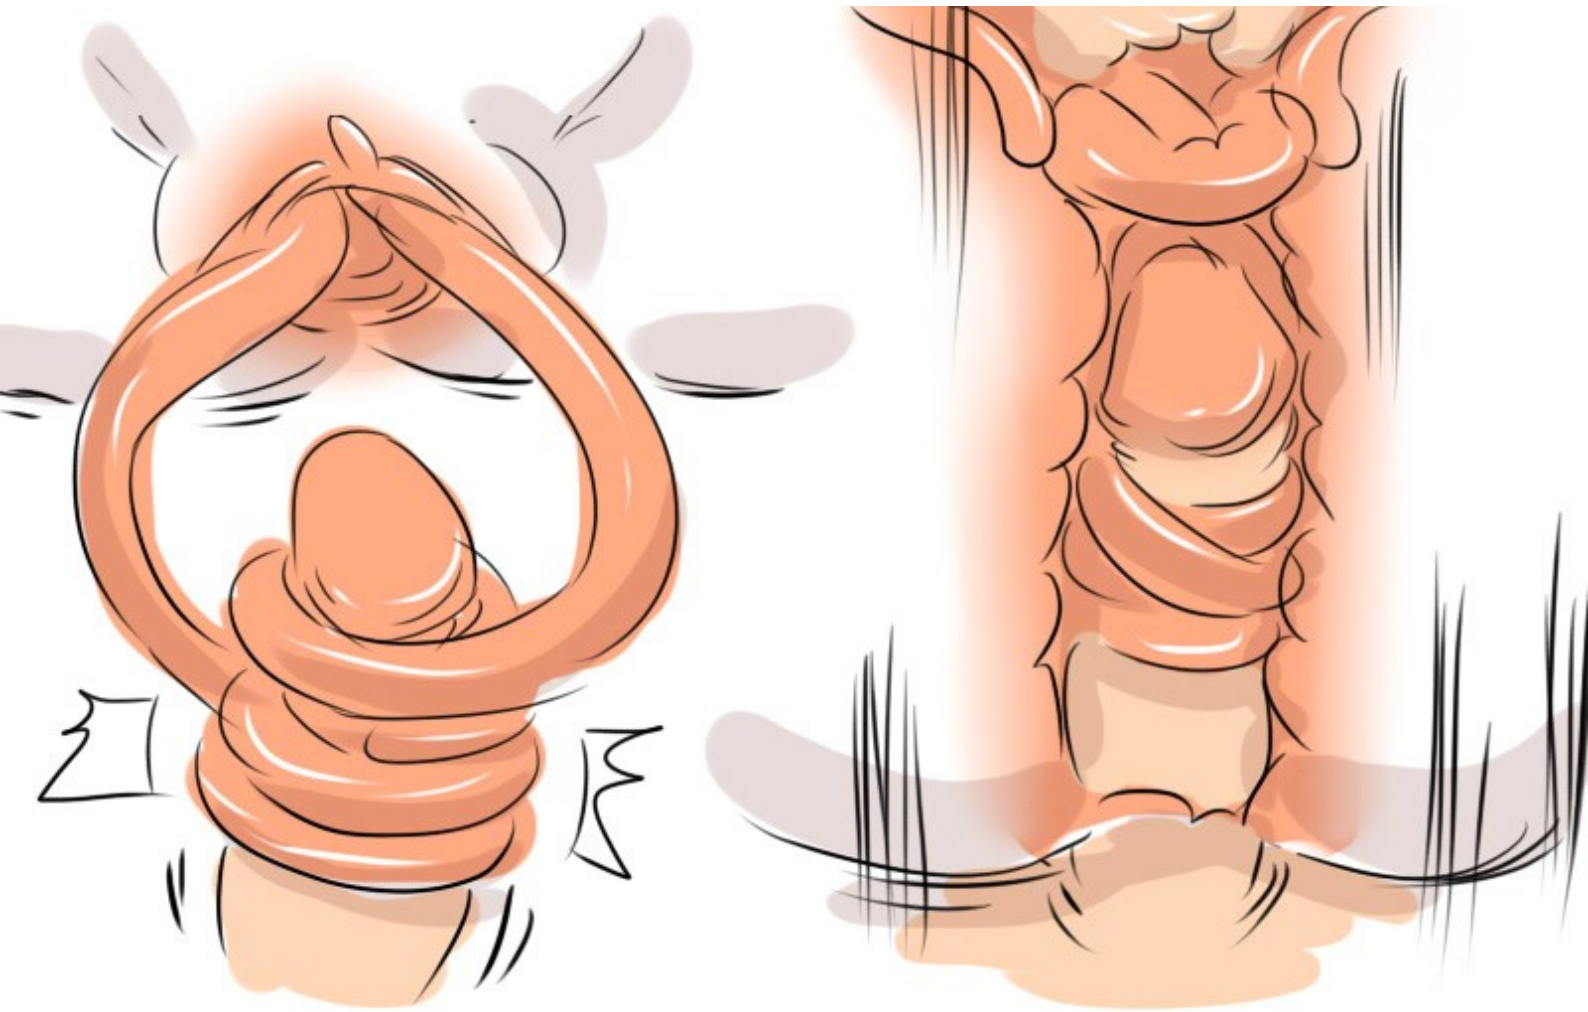

Once a tacit understanding is developed by Tentacle 44, a neural connection is made between the host and Tentacle 44, enabling the host to mate and sow with other women like a man.

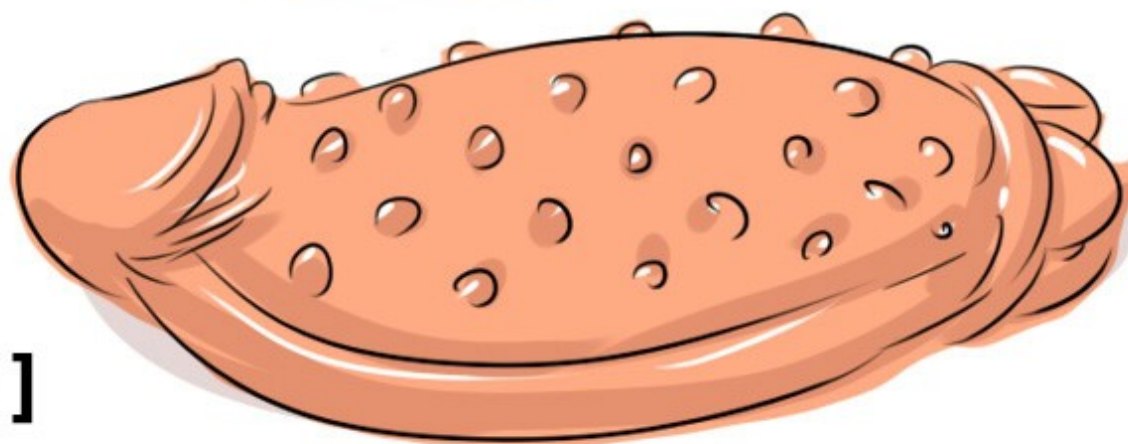

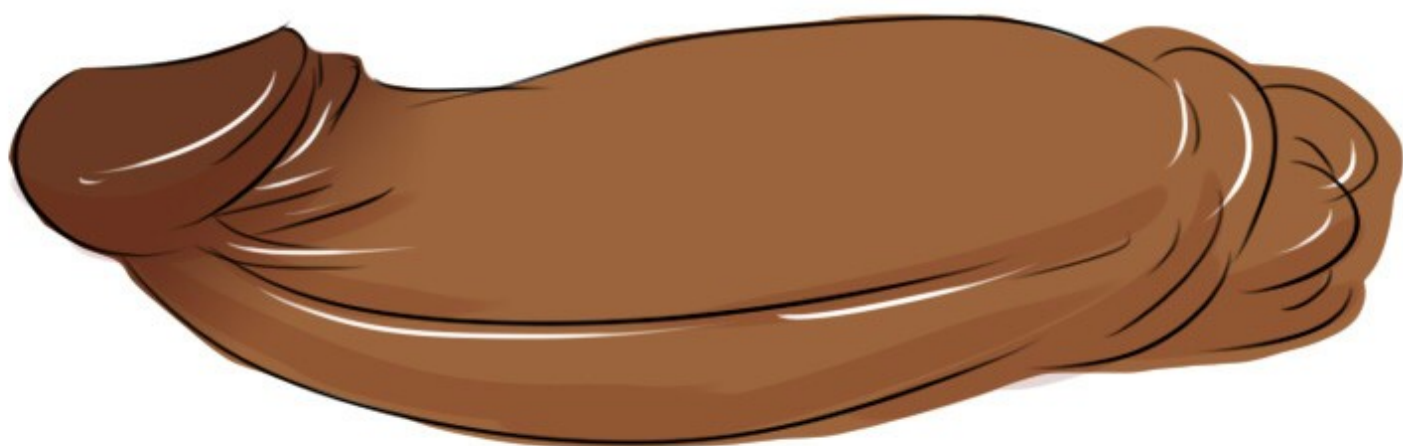

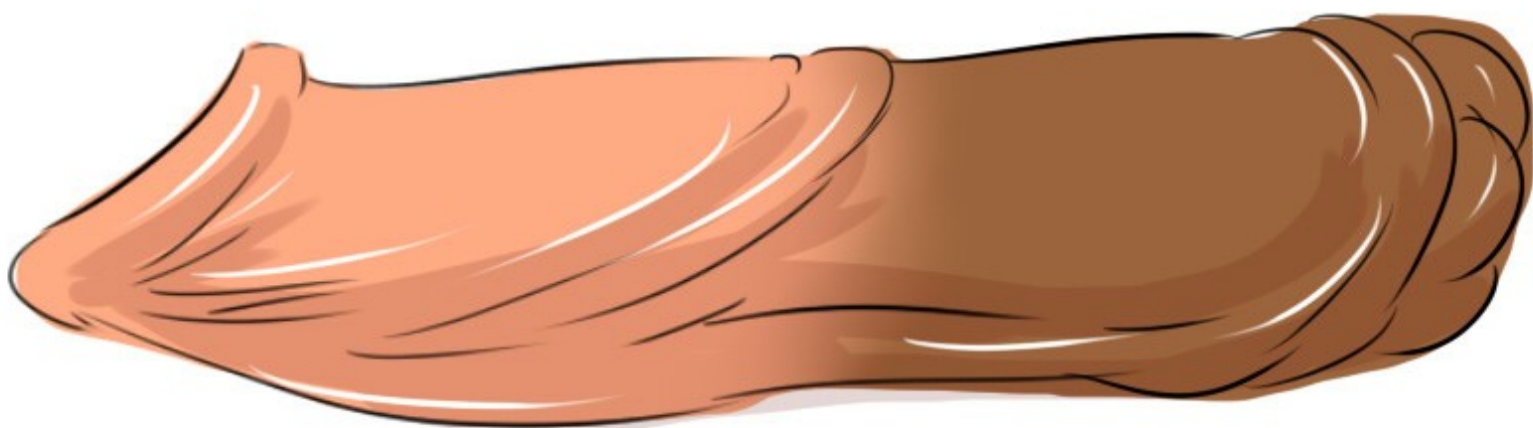

Tentacle 44 is able to fertilize other women to reproduce.

Once they've had enough proficiency, the host can control the lower tentacles at will, which can play a very important role in mating with men. Tentacle 44 feeds on secretions, and male semen is great food for him.
